

# HTML5 and CSS3 for Mobile Applications

---

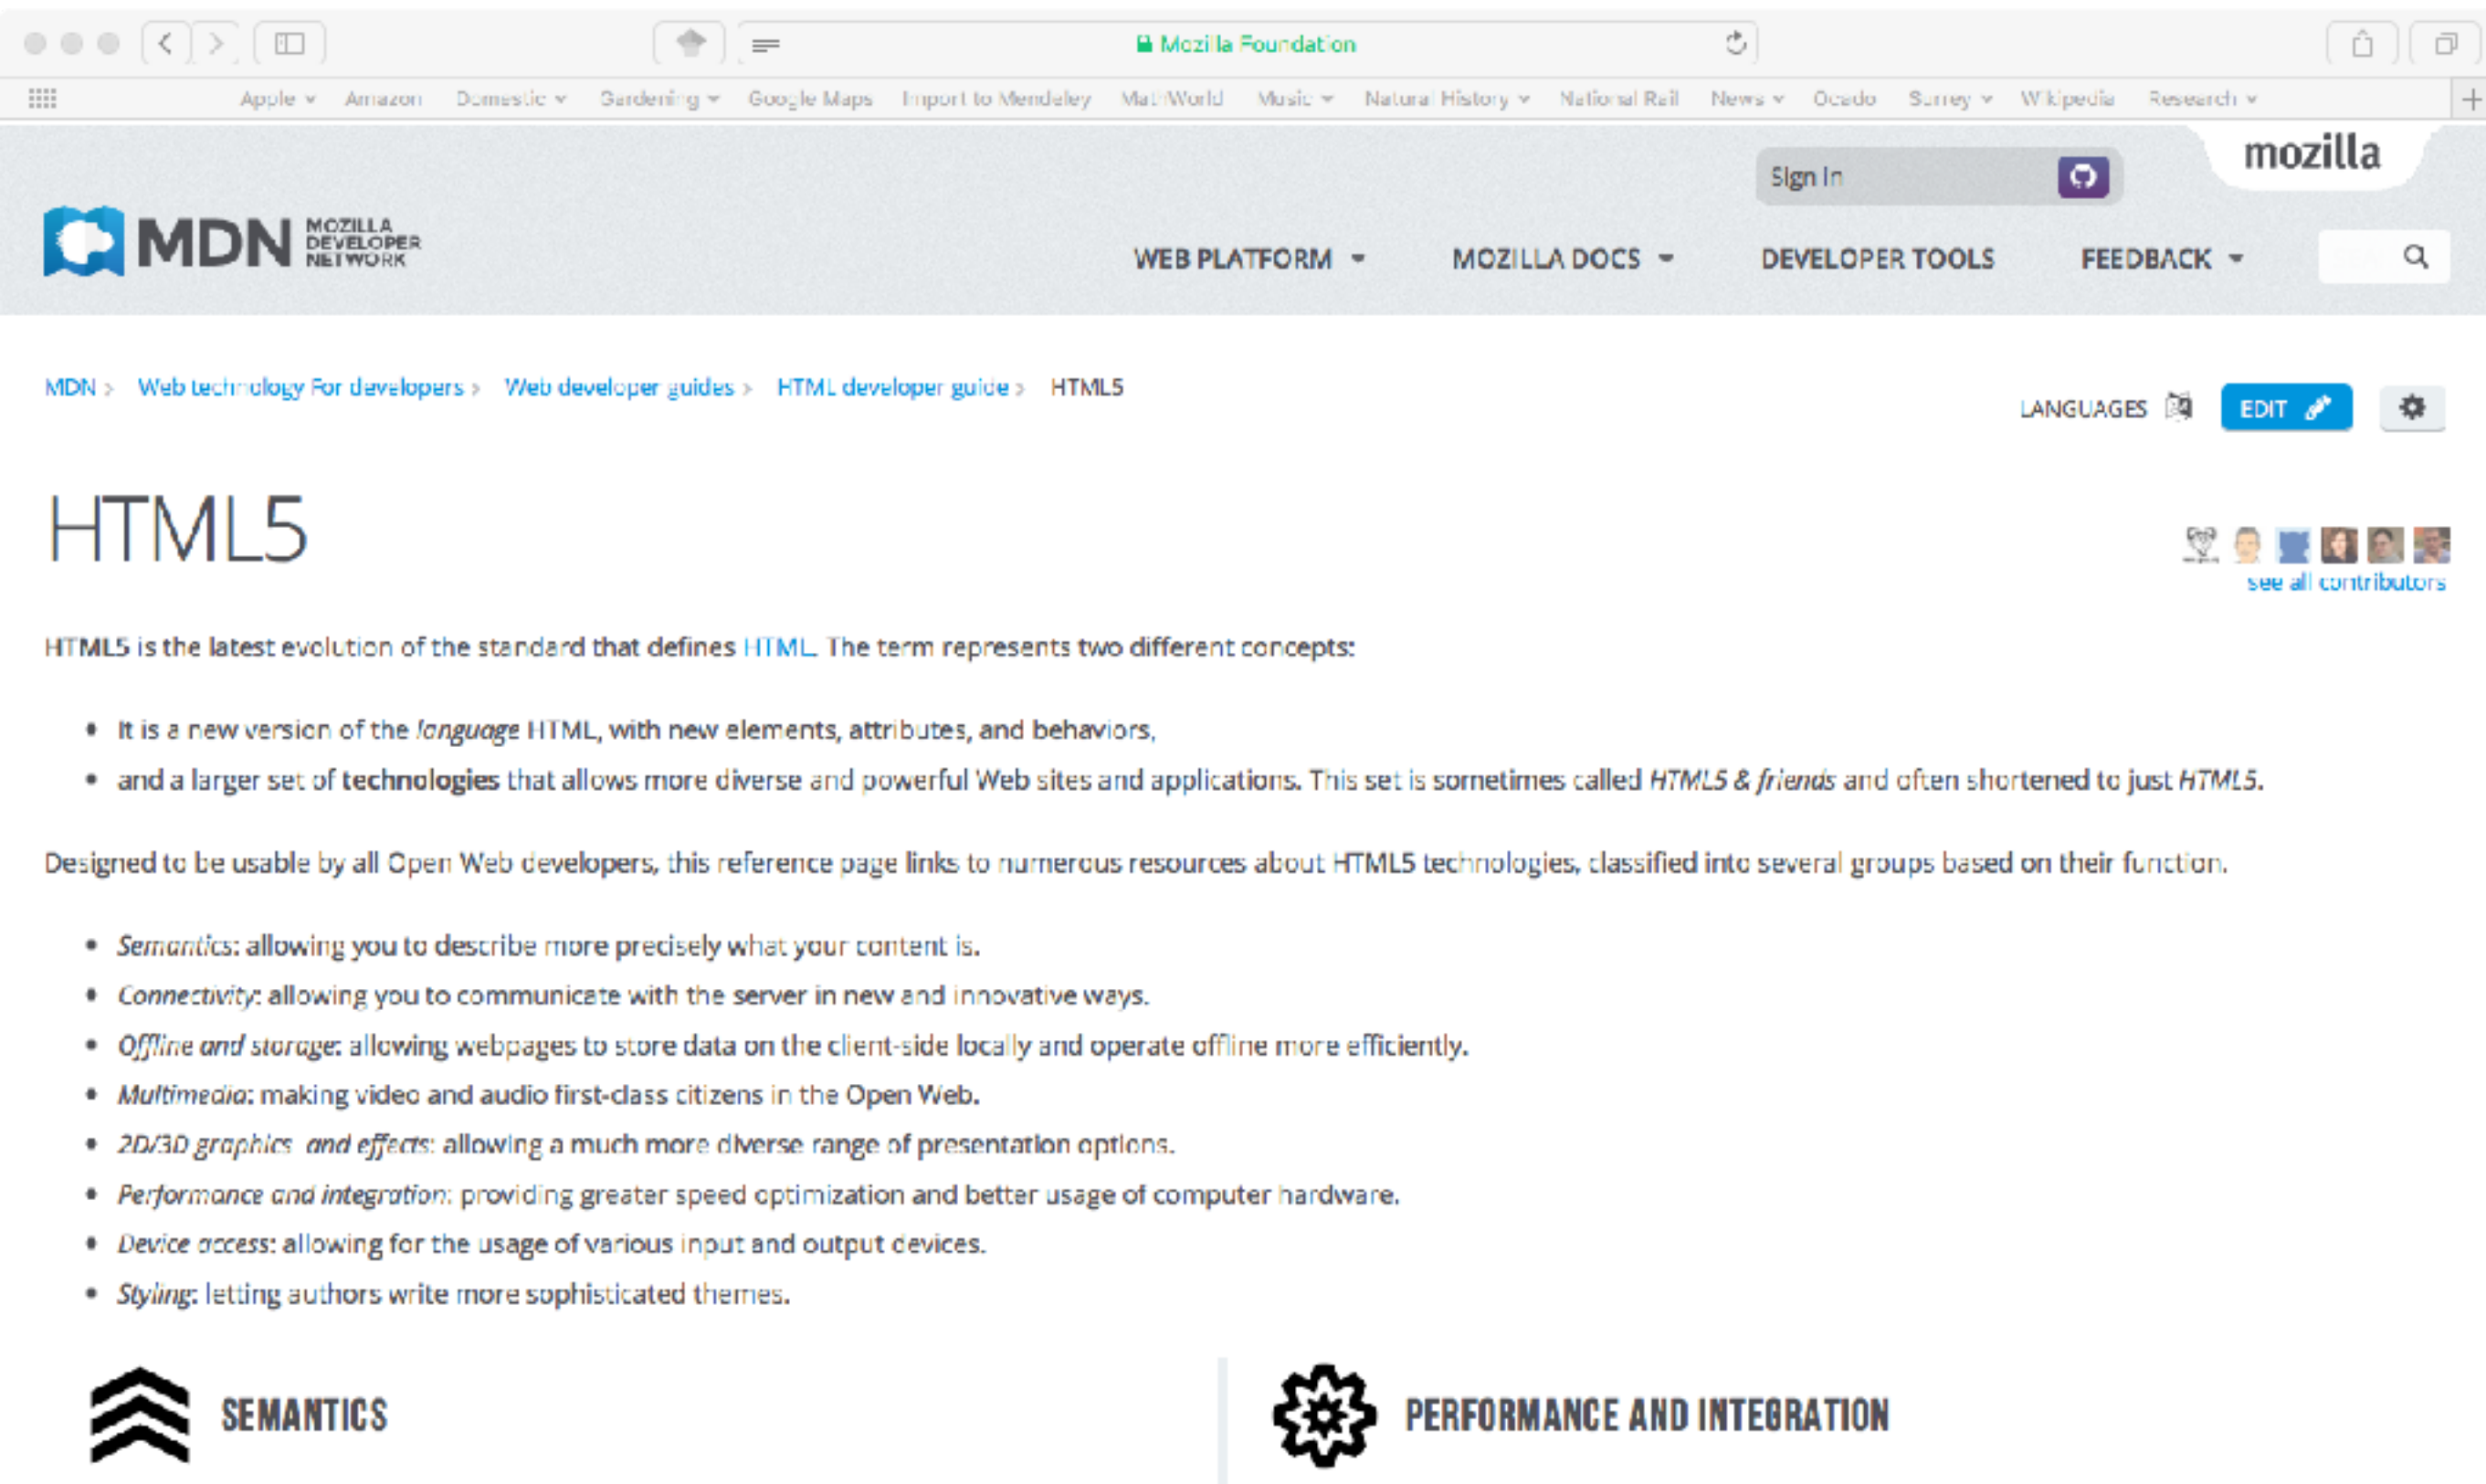

Prof. Paul Krause, University of Surrey  
What did HTML5 ever do for us?

# Why is HTML5 a game changer?

---

- Pros for HTML5 Web Apps
  - Easier to build and iterate
  - Use existing skills in HTML and CSS
  - Same technology across all devices
  - All mobile browsers support HTML5 Audio and Video
    - Control via the DOM, style via CSS
  - Geolocation API
  - Offline content and storage

<https://developer.mozilla.org/en-US/docs/Web/Guide/HTML/HTML5>

The screenshot shows the Mozilla Developer Network (MDN) website. The browser's address bar displays the URL <https://developer.mozilla.org/en-US/docs/Web/Guide/HTML/HTML5>. The MDN logo is in the top left, and the Mozilla logo is in the top right. A navigation bar includes links for Web Platform, Mozilla Docs, Developer Tools, and Feedback. The breadcrumb trail reads: MDN > Web technology For developers > Web developer guides > HTML developer guide > HTML5. The main heading is "HTML5". Below it, a paragraph states: "HTML5 is the latest evolution of the standard that defines HTML. The term represents two different concepts:" followed by a bulleted list: 

- It is a new version of the *language* HTML, with new elements, attributes, and behaviors,
- and a larger set of *technologies* that allows more diverse and powerful Web sites and applications. This set is sometimes called *HTML5 & friends* and often shortened to just *HTML5*.

Another paragraph follows: "Designed to be usable by all Open Web developers, this reference page links to numerous resources about HTML5 technologies, classified into several groups based on their function." This is followed by another bulleted list: 

- *Semantics*: allowing you to describe more precisely what your content is.
- *Connectivity*: allowing you to communicate with the server in new and innovative ways.
- *Offline and storage*: allowing webpages to store data on the client-side locally and operate offline more efficiently.
- *Multimedia*: making video and audio first-class citizens in the Open Web.
- *2D/3D graphics and effects*: allowing a much more diverse range of presentation options.
- *Performance and integration*: providing greater speed optimization and better usage of computer hardware.
- *Device access*: allowing for the usage of various input and output devices.
- *Styling*: letting authors write more sophisticated themes.

At the bottom, there are two sections: "SEMANTICS" with a chevron icon and "PERFORMANCE AND INTEGRATION" with a gear icon.

MDN > Web technology For developers > Web developer guides > HTML developer guide > HTML5

# HTML5

HTML5 is the latest evolution of the standard that defines [HTML](#). The term represents two different concepts:

- It is a new version of the *language* HTML, with new elements, attributes, and behaviors,
- and a larger set of *technologies* that allows more diverse and powerful Web sites and applications. This set is sometimes called *HTML5 & friends* and often shortened to just *HTML5*.

Designed to be usable by all Open Web developers, this reference page links to numerous resources about HTML5 technologies, classified into several groups based on their function.

- *Semantics*: allowing you to describe more precisely what your content is.
- *Connectivity*: allowing you to communicate with the server in new and innovative ways.
- *Offline and storage*: allowing webpages to store data on the client-side locally and operate offline more efficiently.
- *Multimedia*: making video and audio first-class citizens in the Open Web.
- *2D/3D graphics and effects*: allowing a much more diverse range of presentation options.
- *Performance and integration*: providing greater speed optimization and better usage of computer hardware.
- *Device access*: allowing for the usage of various input and output devices.
- *Styling*: letting authors write more sophisticated themes.

 SEMANTICS

 PERFORMANCE AND INTEGRATION

What is HTML?

# What is HTML?

---

- Hypertext Markup Language
- “A language to describe the contents of web documents”

[W3C: The Basics of HTML]

# “A language to describe the contents of Web Documents”

---

- How does it do that?
- It uses tags

<p>

</p>

# “A language to describe the contents of Web Documents”

---

- How does it do that?
- It uses *tags*

<p>To divide the document up into meaningful elements</p>

# “A language to describe the contents of Web Documents”

---

- How does it do that?
- It uses *tags*

<p>To divide the document up into meaningful **<em>elements</em>**</p>

# “A language to describe the contents of Web Documents”

---

- How does it do that?
- It uses *tags*

<p>To divide the document up into meaningful **<em>elements</em>**</p>

N.B. The delineation between block and inline elements has been removed from the specification

# Why is this important?

---

- So that *user agents* can read and interpret those documents
- Those user agents can be created by anyone
- “User agents” include, but are not limited to, Web browsers
  - Think also of search engines, indexing tools, ...

# Building a Document Template

---

```
1 <!DOCTYPE html>
2 <html>
3   <head>
4     <title>Meta data goes here</title>
5   </head>
6   <body>
7     <p>
8       This is where your marked up content goes.
9     </p>
10  </body>
11 </html>
```

# Setting the document's primary language

---

- This is rarely done, but will help search engines and screen readers
  - Especially if the primary language is not english
- Use the “lang” attribute to do this:
  - e.g. `<html lang=“en-GB”>`
  - The “lang” attribute can also be used in lower level elements
- For language codes see:
  - <http://www.w3.org/International/articles/language-tags/>

# Revision of the template

---

```
1 <!DOCTYPE html>
2 <html lang="en-GB">
3   <head>
4     <title>Meta data goes here</title>
5   </head>
6   <body>
7     <p>
8       This is where your marked up content goes.
9     </p>
10  </body>
11 </html>
```

# Revision of the template

---

```
1 <!DOCTYPE html>
2 <html lang="en-GB">
3   <head>
4     <title>Meta data goes here</title>
5   </head>
6   <body>
7     <p>
8       This is where your marked up content goes.
9     </p>
10  </body>
11 </html>
```

# Character Encoding

# Basics of character encoding

---

- Old days of ASCII:
  - Characters represented as a number between 32 and 127
  - Needed 7 bits to encode, so for 8 bit bytes there was one bit to spare
  - That led to all sorts of ideas on how to use the codes between 128 and 255

# Unicode supports Internationalisation

---

- Provides a standard mapping from characters (in any language) to *code points*
- For example, the letter A maps to U+0041
  - The digits are hex characters
- But these in turn need to be encoded into bits, and there are alternative ways to do this
  - e.g. UTF-8; UTF-16; UTF-32 (and variants thereof :())

# HTML5 recommends UTF-8

---

- Every code point from 0-127 is stored as a single byte
  - So ASCII and UTF-8 coincide
  - And documents involving predominantly ASCII characters are quite compact
- Code points above 128 are stored in 2, 3, ... 6 bytes

“There Ain’t No Such Thing As Plain Text”

See *Joel on Software*

<http://www.joelonsoftware.com/articles/Unicode.html>

# Rule #1: Define your charset as soon as you can

---

```
1 <!DOCTYPE html>
2 <html lang="en-GB">
3   <head>
4     <meta charset="utf-8">
5     <title>Meta data goes here</title>
6     <meta name="description" content="Make the description
7       concise and relevant">
8     <meta name="keywords" content="use, primarily, internally">
9     <link rel="stylesheet" type="text/css" href="mystyle.css">
10    <script src="myscript.js"></script>
11  </head>
12  <body>
13    <p>
14      This is where your marked up content goes.
15    </p>
16  </body>
17</html>
```

# Rule #2: Character references should be eliminated

---

- Which is easier to read?

`<h1>audio vérité</h1>`

`<h1>audio v&#233;rit&#233;</h1>`

`<h1>audio v&eacute;rit&eacute;</h1>`

- The same applies to @ and ©
- But you will need to use references for those characters that have meaning in HTML: `&gt;`, `&lt;` and (possibly) `&amp;` for `<`, `>`, `&` respectively

The Title element

# The <title> element

---

- This is the only element you *must* have in the <head>
- <title> cannot contain any nested elements
- It is the first piece of content of your document that most user agents will see
- Make sure it is concise, but informative
  - and don't try to trick search engines!

# For Example:

---

```
1  <!DOCTYPE html>
2  <html lang="en-GB">
3      <head>
4          <meta charset="utf-8">
5          <title>WI Temperance Society | About Us</title>
6      </head>
7      <body>
8          <p>
9              This is where your marked up content goes.
10         </p>
11     </body>
12 </html>
```

# For Example:

---

```
1 <!DOCTYPE html>
2 <html lang="en-GB">
3   <head>
4     <meta charset="utf-8">
5     <title>WI Temperance Society | About Us</title>
6   </head>
7   <body>
8     <p>
9       This is where your marked up content goes.
10    </p>
11  </body>
12 </html>
```

# For Example:

---

```
1  <!DOCTYPE html>
2  <html lang="en-GB">
3      <head>
4          <meta charset="utf-8">
5          <title>WI Temperance Society | About Us</title>
6      </head>
7      <body>
8          <p>
9              This is where your marked up content goes.
10         </p>
11     </body>
12 </html>
```

# Add a description

---

```
1 <!DOCTYPE html>
2 <html lang="en-GB">
3   <head>
4     <meta charset="utf-8">
5     <title>WI Temperance Society | About Us</title>
6     <meta name="description" content="Following the recent
  shocking and disturbing behaviour after drinking alcohol of
  certain members of the Royal Family of a formerly great
  country, the WI Temperance society was set up to tackle the
  problem at root cause.">
7   </head>
8   <body>
9     <p>
10      This is where your marked up content goes.
11    </p>
12  </body>
13 </html>
```

# Add a description

---

```
1 <!DOCTYPE html>
2 <html lang="en-GB">
3   <head>
4     <meta charset="utf-8">
5     <title>WI Temperance Society | About Us</title>
6     <meta name="description" content="Following the recent
    shocking and disturbing behaviour after drinking alcohol of
    certain members of the Royal Family of a formerly great
    country, the WI Temperance society was set up to tackle the
    problem at root cause.">
7   </head>
8   <body>
9     <p>
10      This is where your marked up content goes.
11    </p>
12  </body>
13 </html>
```

# Add a description

---

```
1 <!DOCTYPE html>
2 <html lang="en-GB">
3   <head>
4     <meta charset="utf-8">

# Keywords (stuffing)

---

```
1 <!DOCTYPE html>
2 <html lang="en-GB">
3   <head>
4     <meta charset="utf-8">
5     <title>WI Temperance Society | About Us</title>
6     <meta name="description" content="Following the recent
    shocking and disturbing behaviour after drinking alcohol of
    certain members of the Royal Family of a formerly great
    country, the WI Temperance society was set up to tackle the
    problem at root cause.">
7     <meta name="keywords" content="sex, drugs, rock and roll,
    world of warcraft">
8   </head>
9   <body>
10    <p>
11      This is where your marked up content goes.
12    </p>
13  </body>
14 </html>
```

# But keywords can still be useful

---

- If you are building a large website, keywords on subpages can be used very effectively to search within, and navigate around, the website

# And finally

---

- The <head> element is the place where you should include the import statements for the style sheets and scripts that will be used by your document
- Remember:
  - On the basis of parsimony, put only what is absolutely necessary in your html document
  - Styling can be changed while keeping the content the same
  - Scripting can be changed while keeping the content the same
    - So stylesheets and scripts belong in separate files

# What We Have Done

---

```
1 <!DOCTYPE html>
2 <html lang="en-GB">
3   <head>
4     <meta charset="utf-8">
5     <title>Meta data goes here</title>
6     <meta name="description" content="Make the description
7       concise and relevant">
8     <meta name="keywords" content="use, primarily, internally">
9     <link rel="stylesheet" type="text/css" href="mystyle.css">
10    <script src="myscript.js"></script>
11  </head>
12  <body>
13    <p>
14      This is where your marked up content goes.
15    </p>
16  </body>
17</html>
```

Structuring your document

# Document outlines

---

- Where does my web document start, what are the main sections and what are their respective subsections?
- This is captured by the *Document Outline*
- In HTML 4, the only way to create a document outline was to use the <h1> - <h6> elements
  - This leads to a number of issues
- HTML 5 provides much stronger support for creating a document outline
  - Why is this important?

So you thought you had a single root?

---

```
7  <body>
8    <div id="header">
9      <h1>What makes a good role model</h1>
10    </div>
11    <div class="entry">
12      <h1>Jessy J</h1>
13      <p>
14        Why does Jessy J get so much press when Lilly Allen is
15        so much funnier?
16      </p>
17    </div>
18    <div class="entry">
19      <h1>Posh Spice</h1>
20      <p>
21        Why does Posh Spice get so much press when Lilly Allen
22        has so much more to say?
23      </p>
24    </div>
25  </body>
```

So you thought you had a single root?

---

```
7  <body>
8  <div id="header">
9  <h1>What makes a good role model</h1>
10 </div>
11 <div class="entry">
12 <h1>Jessy J</h1>
13 <p>
14   Why does Jessy J get so much press when Lilly Allen is
15   so much funnier?
16 </p>
17 </div>
18 <div class="entry">
19 <h1>Posh Spice</h1>
20 <p>
21   Why does Posh Spice get so much press when Lilly Allen
22   has so much more to say?
23 </p>
24 </div>
25 </body>
```

So you thought you had a single root?

---

```
7  <body>
8    <div id="header">
9      <h1>What makes a good role model</h1>
10    </div>
11    <div class="entry">
12      <h1>Jessy J</h1>
13      <p>
14        Why does Jessy J get so much press when Lilly Allen is
15        so much funnier?
16      </p>
17    </div>
18    <div class="entry">
19      <h1>Posh Spice</h1>
20      <p>
21        Why does Posh Spice get so much press when Lilly Allen
22        has so much more to say?
23      </p>
24    </div>
25  </body>
```

So you thought you had a single root?

---

```
7  <body>
8    <div id="header">
9      <h1>What makes a good role model</h1>
10    </div>
11    <div class="entry">
12      <h1>Jessy J</h1>
13      <p>
14        Why does Jessy J get so much press when Lilly Allen is
15        so much funnier?
16      </p>
17    </div>
18    <div class="entry">
19      <h1>Posh Spice</h1>
20      <p>
21        Why does Posh Spice get so much press when Lilly Allen
22        has so much more to say?
23      </p>
24    </div>
25  </body>
```

So you thought you had a single root?

---

```
7  <body>
8    <div id="header">
9      <h1>What makes a good role model</h1>
10    </div>
11    <div class="entry">
12      <h1>Jessy J</h1>
13      <p>
14        Why does Jessy J get so much press when Lilly Allen is
15        so much funnier?
16      </p>
17    </div>
18    <div class="entry">
19      <h1>Posh Spice</h1>
20      <p>
21        Why does Posh Spice get so much press when Lilly Allen
22        has so much more to say?
23      </p>
24    </div>
25  </body>
```

<http://gsnedders.html5.org/outline/>

---

So I have to do this

---

```
7  <body>
8    <div id="header">
9      <h1>What makes a good role model</h1>
10   </div>
11   <div class="entry">
12     <h2>Jessy J</h2>
13     <p>
14       Why does Jessy J get so much press when Lilly Allen is
15       so much funnier?
16     </p>
17   </div>
18   <div class="entry">
19     <h2>Posh Spice</h2>
20     <p>
21       Why does Posh Spice get so much press when Lilly Allen
22       has so much more to say?
23     </p>
24   </div>
25 </body>
```

So I have to do this

---

```
7  <body>
8    <div id="header">
9      <h1>What makes a good role model</h1>
10   </div>
11   <div class="entry">
12     <h2>Jessy J</h2>
13     <p>
14       Why does Jessy J get so much press when Lilly Allen is
15       so much funnier?
16     </p>
17   </div>
18   <div class="entry">
19     <h2>Posh Spice</h2>
20     <p>
21       Why does Posh Spice get so much press when Lilly Allen
22       has so much more to say?
23     </p>
24   </div>
25 </body>
```

So I have to do this

---

```
7  <body>
8    <div id="header">
9      <h1>What makes a good role model</h1>
10   </div>
11   <div class="entry">
12     <h2>Jessy J</h2>
13     <p>
14       Why does Jessy J get so much press when Lilly Allen is
15       so much funnier?
16     </p>
17   </div>
18   <div class="entry">
19     <h2>Posh Spice</h2>
20     <p>
21       Why does Posh Spice get so much press when Lilly Allen
22       has so much more to say?
23     </p>
24   </div>
25 </body>
```

# Got what I want, but I hacked it

---

Now let's do it properly, the HTML5 way

# Our first two new elements

---

`<header>`

- Defines a header region of a page, section or article

`<article>`

- Defines a self-contained piece of content

# One header and two articles

---

```
7  <body>
8    <header>
9      <h1>What makes a good role model</h1>
10   <header>
11   <article>
12     <h1>Jessy J</h1>
13     <p>
14       Why does Jessy J get so much press when Lilly Allen is
15       so much funnier?
16     </p>
17   </article>
18   <article>
19     <h1>Posh Spice</h1>
20     <p>
21       Why does Posh Spice get so much press when Lilly Allen
22       has so much more to say?
23     </p>
24   </article>
25 </body>
```

# One header and two articles

---

```
7  <body>
8  <header>
9  <h1>What makes a good role model</h1>
10 </header>
11 <article>
12 <h1>Jessy J</h1>
13 <p>
14   Why does Jessy J get so much press when Lilly Allen is
15   so much funnier?
16 </p>
17 </article>
18 <article>
19 <h1>Posh Spice</h1>
20 <p>
21   Why does Posh Spice get so much press when Lilly Allen
22   has so much more to say?
23 </p>
24 </article>
25 </body>
```

Tables

# Just in case

---

In historical days, web developers used tables to layout elements on a page

Just in case

---

# Let's start a proper table

---

```
1 <table>
2   <tr>
3     <td>Plant Name</td>
4     <td>Promise</td>
5     <td>Problem</td>
6   </tr>
7 </table>
```

# Let's start a proper table

---

Indicates the content needs to be arranged in tabular fashion

```
1 <table>
2   <tr>
3     <td>Plant Name</td>
4     <td>Promise</td>
5     <td>Problem</td>
6   </tr>
7 </table>
```

# Let's start a proper table

---

A table row

```
1 <table>
2   <tr>
3     <td>Plant Name</td>
4     <td>Promise</td>
5     <td>Problem</td>
6   </tr>
7 </table>
```

# Let's start a proper table

---

```
1 <table>
2   <tr>
3     <td>Plant Name</td>
4     <td>Promise</td>
5     <td>Problem</td>
6   </tr>
7 </table>
```

A table cell

# Let's start a proper table

---

```
1 <table>
2   <tr>
3     <td>Plant Name</td>
4     <td>Promise</td>
5     <td>Problem</td>
6   </tr>
7 </table>
```

add some content ...

---

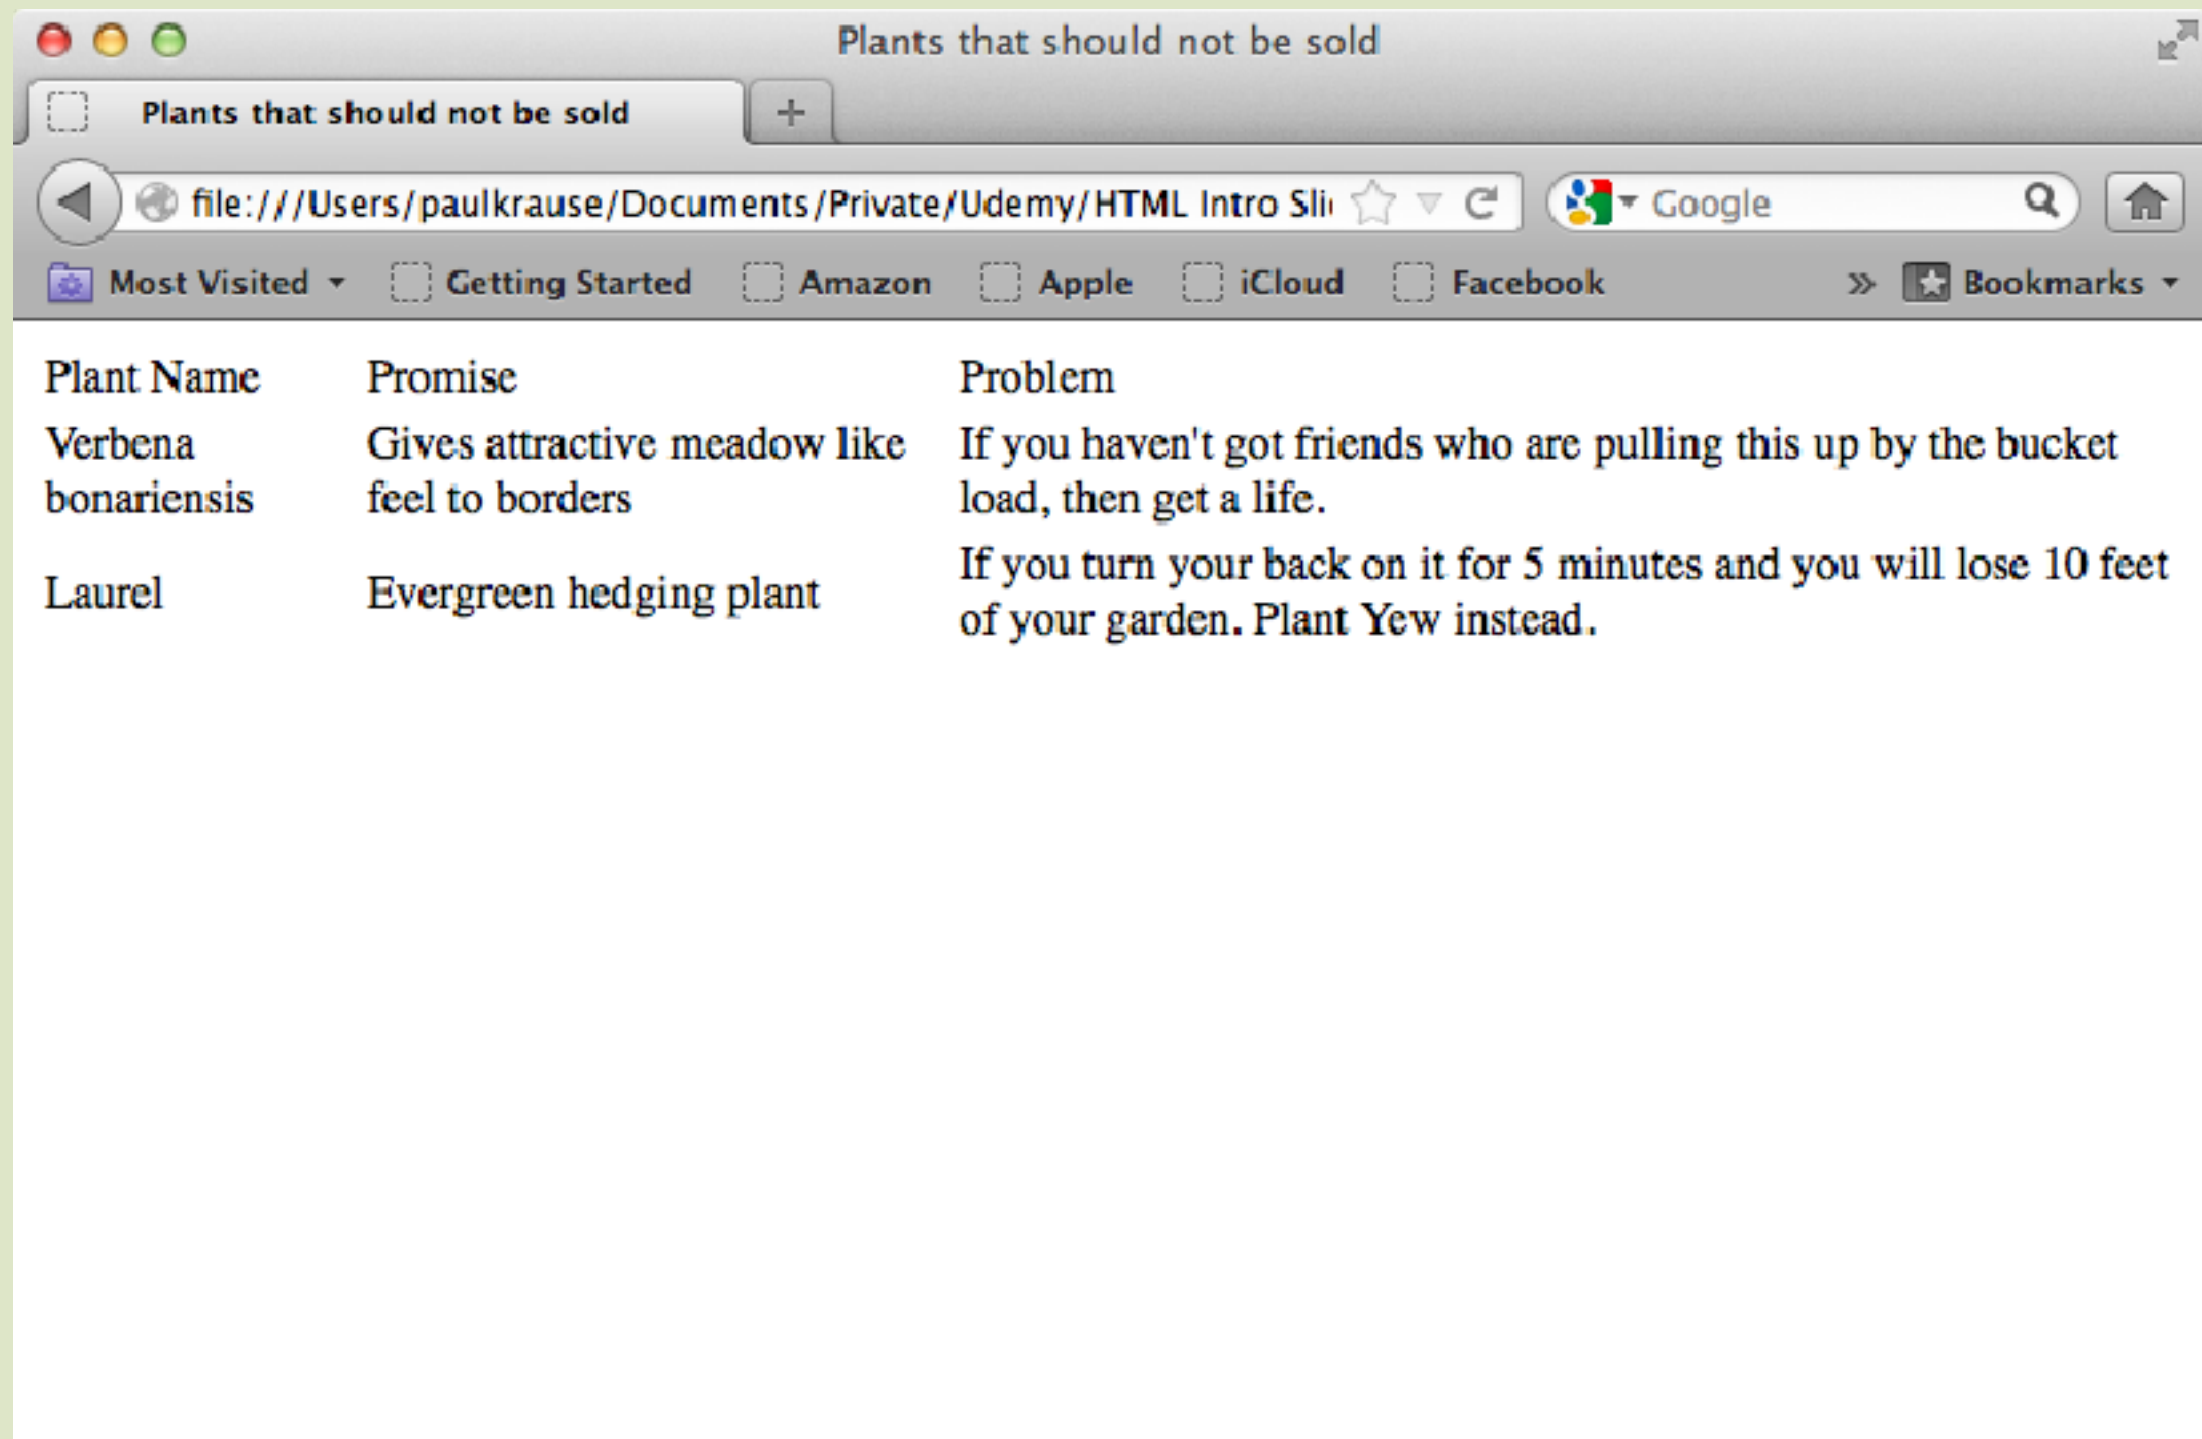

```
1 <table>
2   <tr>
3     <td>Plant Name</td>
4     <td>Promise</td>
5     <td>Problem</td>
6   </tr>
7   <tr>
8     <td>Verbena bonariensis</td>
9     <td>Gives attractive meadow like feel to borders</td>
10    <td>
11      If you haven't got friends who are pulling this up by
12      the bucket load, then get a life.
13    </td>
14  </tr>
15  <tr>
16    <td>Laurel</td>
17    <td>Evergreen hedging plant</td>
18    <td>
19      If you turn your back on it for 5 minutes and you will
20      lose 10 feet of your garden. Plant Yew instead.
21    </td>
22  </tr>
23 </table>
```

    </td>
  </tr>
</tfoot>
```

# And finally

---

```
<thead>
  <tr>
    <th scope="col">Plant Name</th>
    <th scope="col">Promise</th>
    <th scope="col">Problem</th>
  </tr>
</thead>
<tfoot>
  <tr>
    <td colspan="3">
      Compiled <time datetime="2012-09-04">September 2015</time>
    </td>
  </tr>
</tfoot>
```

Looks like ...

# What We Have Done

---

- We have shown the basics of using tables for organizing data
- For more detail, take a look at Roger Johansson's article:
  - [http://www.456bereastreet.com/archive/200410/bring\\_on\\_the\\_tables/](http://www.456bereastreet.com/archive/200410/bring_on_the_tables/)

Now some good form(s)

# A basic form

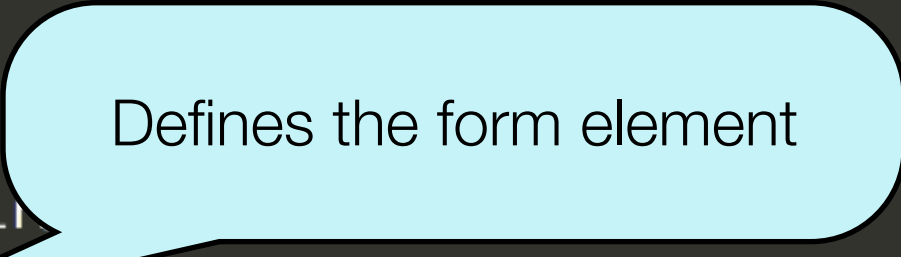

---

```
1 <!DOCTYPE html>
2 <html lang="en-GB">
3   <head>
4     <meta charset="utf-8">
5     <title>HTML Forms</title>
6   </head>
7   <body>
8     <header>
9       <h1>My First Form</h1>
10    </header>
11    <form>
12      Event Details: <textarea name="details" id="details"></textarea>
13      <input type="submit" value="Submit">
14    </form>
15  </body>
16 </html>
```

# A basic form

---

```
1 <!DOCTYPE html>
2 <html lang="en-GB">
3   <head>
4     <meta charset="utf-8">
5     <title>HTML Forms</title>
6   </head>
7   <body>
8     <header>
9       <h1>My Fil
10    </header>
11    <form>
12      Event Details: <textarea name="details" id="details"></textarea>
13      <input type="submit" value="Submit">
14    </form>
15  </body>
16 </html>
```

Defines the form element

# A basic form

---

```
1 <!DOCTYPE html>
2 <html lang="en-GB">
3   <head>
4     <meta charset="utf-8">
5     <title>HTML Forms</title>
6   </head>
7   <body>
8     <header>
9       <h1>My First Form</h1>
10    <header>
11    <form>
12      Event Details: <textarea name="details" id="details"></textarea>
13      <input type="submit" value="Submit">
14    </form>
15  </body>
16 </html>
```

An input element where free text can be entered.

# A basic form

---

```
1 <!DOCTYPE html>
2 <html lang="en-GB">
3   <head>
4     <meta charset="utf-8">
5     <title>HTML Forms</title>

17 </html>
```

Starting to look a bit messy!

---

The screenshot shows a web browser window with the title "HTML Forms". The address bar displays a file path: `file:///Users/paulkrause/Documents/Private/Udemy/HTML%`. Below the address bar is a toolbar with various icons and a search bar. The main content area of the browser displays a form titled "My First Form". The form consists of two input fields: "Title:" and "Event Details:". The "Event Details:" field is larger and has a small icon in the bottom right corner. A "Submit" button is located to the right of the "Event Details:" field.

**My First Form**

Title:  Event Details:

27  </fieldset>
28  </form>
```

Now fully described and ready to style!

The screenshot shows a web browser window with the title "HTML Forms". The address bar displays the file path: `file:///Users/paulkrause/Documents/Private/Udemy/HTML%`. The browser's toolbar includes navigation buttons (back, forward, home, stop), a search bar with suggestions like "Amazon", "Apple", "iCloud", "Facebook", "Yahoo!", "News", and "Research", and a "Reader" button. The main content area features a heading "My First Form" in a large, bold, serif font. Below the heading is a form titled "Submit a new event" enclosed in a rectangular border. Inside this border, there is a bulleted list with three items: "Event Title:" followed by a text input field, "Event Details:" followed by a larger text area, and "Submit" followed by a button.

## My First Form

Submit a new event

- Event Title:
- Event Details:
-

# But what happens when the form is submitted?

---

```
11 <form action="action_name" method="post">

# Media Queries

# Media Queries

---

- General format:

```
@media screen and (max-width: 400px) {  
    /* Query specific CSS goes here */  
}
```

- Media queries can also test for:
  - width; height; device-width; device-height; orientation; aspect-ratio; color; resolution; scan ...

# Scalable Vector Graphics

# Advantages of SVG

---

- Small file size
- Can be changed with scripting
- Scales without pixelated or jagged edges
- Easy to understand
- Can be animated

# Japanese flag

---

```
1 <!DOCTYPE svg PUBLIC "-//W3C//DTD SVG 1.0//EN"
2   "http://www.w3.org/TR/2001/REC-SVG-20010904/DTD/svg10.dtd">
3 <svg xmlns="http://www.w3.org/2000/svg" height="220" width="320" version="1.0">
4   <title>Japanese Flag</title>
5   <desc>Red circle on white flag</desc>
6   <rect x="10" y="10" width="300" height="200" style="fill: #ffffff; stroke: #e7e7e7;"/>
7   <circle cx="160px" cy="107px" r="60px" fill="#d60818"/>
8 </svg>
9
```

# Including an svg file in a document

---

```
1  
2  
3 
```

```
4  
5 or
```

```
6  
7 <embed type="image/svg+xml" src="flag.svg" width="320" height="220"/>
```

```
8  
9 or
```

```
10  
11 <object data="flag.svg" type="image/svg+xml" width="320" height="220"></object>  
12  
13
```

Canvases

# Adding a canvas to a document

---

```
1 <!DOCTYPE html>
2 <html lang="en-GB">
3   <head>
4     <meta charset="utf-8" />
5     <title>Japanese Flag</title>
6     <meta name="description" content="Japanese flag in JavaScript" />
7   </head>
8   <body>
9     <canvas id="flag" width="320" height="220">
10      If you can see this then you are not supporting Canvases!!
11    </canvas>
12  </body>
13
14
15
```

# Drawing the flag in JavaScript

```
13 <script>
14   var el= document.getElementById("flag");
15
16   if (el && el.getContext) {
17     var context = el.getContext('2d');
18     if (context) {
19       context.fillStyle = "#ffffff";
20       context.strokeStyle = "#cccccc";
21       context.lineWidth = 1;
22       context.shadowOffsetX = 5;
23       context.shadowOffsetY = 5;
24       context.shadowBlur = 4;
25       context.shadowColor = 'rgba(0, 0, 0, 0.4)';
26       context.strokeRect(10, 10, 300, 200);
27       context.fillRect(10, 10, 300, 200);
28       context.shadowColor='rgba(0,0,0,0)';
29       context.beginPath();
30       context.fillStyle = "#d60818";
31       context.arc(160, 107, 60, 0, Math.PI*2, false);
32       context.closePath();
33       context.fill();
34     }
35   }
36 </script>
```

# Compare and contrast

---

- SVG you draw in XML; with Canvas, you draw in JavaScript;
- SVG creates DOM nodes that can be manipulated, and is resolution independent;
- Canvas draws in pixels so pixilates on zooming;
- No animation API with Canvases
- But SVG can perform badly - especially an issue on mobile devices

# What we have done

---

- Skateboard tour through HTML5
  - Clear semantics for `_all_` user agents
  - Wonderfully expressive if used properly
  - Accessible support for graphics with SVG and Canvases
- To Do:
  - Cross-device support for Audio and Video
  - Geolocation API
  - Support for Offline working
